

Chapter 5

Results and Testing

This chapter will describe the results of my work with of W. A. Mozart's *Eine kleine Nachtmusik*, K.525 as an example. It will also use W. A. Mozart's *String Quartet No.7 in E-flat major*, K.160/159a as an example where K.525 doesn't fit the specifications. This chapter will also look at timing metrics of the system.

5.1 Example 1: Eine kleine Nachtmusik, K.525, W. A. Mozart)

This section will go through an example of how the entire `OMRMIDICorrector` system works on W. A. Mozart's *Eine kleine Nachtmusik*, K.525.

5.1.1 Musical Properties of K.525

I chose K.525 as the example piece for many of its music properties that make it a difficult but interesting piece to align.

5.1.1.1 Bass and Cello Doubling

In the original scanned score, there are only four parts because the bass part doubles the cello part one octave lower. However, in the MIDI encoding, there must be five separate voices. Thus, in the preprocessing step of the `OMRMIDICorrector`, it would be ideal for the system to recognize this. Otherwise, in instances where the `OMRMIDICorrector` could not pair up the parts between the input OMR stream and the input MIDI stream, there would be an error thrown, and alignment and correction would not happen.

5.1.1.2 Tremolos

Starting in measure 5 in the original scanned score, the second violin has tremolo notes, instead of repeated 16th notes written out. The OMR parser in SmartScore is not robust enough to recognize the slashes across the stem of the note as tremolo markings and instead interprets it as a single note. The MIDI protocol has no way of indicating tremolos, so the second violin’s notes in measure 5 are encoded as regular 16th notes. Ideally, the aligner would be robust enough to align tremolo measures with non-tremolo measures even though there will be a huge discrepancy in the number of notes present in the measure.

5.1.2 Preparing the Raw Input

The basic raw input of the system is an OMR score and a MIDI file. A scanned copy of the score was found in IMSLP [5], the source for much free public domain sheet music. The MIDI file was sourced from the Yale MIDI Archive.

I used SmartScore’s built-in OMR tool to convert the scanned score of K.525 into an ENF file. Then I exported the post-OMR file as a musicXML file.

Similarly for the K.525 MIDI file, I used SmartScore to parse the original file and exported it as a musicXML file.

The last step of preparing the raw input is to parsing the musicXML files with the `music21` library so that they are `Stream` objects. This can be done by passing in the musicXML filepaths to the `parse` method in the `converter` class. We will call these two parsed streams `k525midiStream` and `k525omrStream`.

```
from music21 import *
k525MidiFilepath = "path/to/k525/midtoxml.xml"
k525OmrFilepath= "path/to/k525/omrtoxml.xml"
k525midistream = converter.parse(k525MidiFilepath)
k525omrstream = converter.parse(k525OmrFilepath)
```

5.1.3 Running OMRMIDICorrector on K.525

After the raw input has been massaged into `Stream` objects, the aligning process is simple. We create an instance of an `OMRMIDICorrector` object with the two streams as parameters. For the purposes of this example, we will use the default hasher that is built into the `OMRMIDICorrector` class. We will set the `debugShow` to `True` so that we can visualize the alignment between pairwise streams. Finally, we will call `processRunner` which will hash and align the parts in the stream. For now, we will manually create the `Fixer` objects for stream fixing. The aligner is able to correctly identify that the repeated 16th notes

```
from music21 import *
OMC = alpha.analysis.omrMidiCorrector
k525omc = OMC.OMRMIDICorrector(k525midistream, k525omrstream)
k525omc.debugShow = True
k525omc.processRunner()
```

These are the outputs of the `showChanges` function.

K.525 Source (OMR) Cello, Bass

Music21

The image displays a musical score for the Cello and Bass parts of K.525, arranged in six systems. The key signature is one sharp (F#) and the time signature is 4/4. The score includes measure numbers and dynamic markings.

- System 1:** Measures 0 to 12. Includes a red dot at measure 7 and a purple dot at measure 12.
- System 2:** Measures 13 to 26. Starts with a measure rest.
- System 3:** Measures 27 to 67. Includes a measure rest at measure 67.
- System 4:** Measures 68 to 78. Includes a measure rest at measure 75 and a dynamic marking *p* at measure 78.
- System 5:** Measures 79 to 91. Includes measure rests at measures 80, 83, 84, 85, 86, and 87, and a measure rest at measure 91.
- System 6:** Measures 92 to 106. Includes dynamic markings *p* at measures 92 and 106.

5.1.3.1 A Closer Look at Specifics of `processrunner`

A lot of magic happens within `processRunner`, all of which is described at a high level in sections 4.1.1.1 - 4.1.1.4. Here are some salient details of the process in the context of K.525 that I think deserve notice:

- Bass Doubles Cello Part - The OMR score has only four parts, whereas the MIDI score has 5. The `checkBassDoublesCello` method in `OMRMIDICorrector` is able to correctly identify this and thus does not reject the input on the basis of having a mismatching number of parts in the stream.
- Rhythmic Fault Tolerance: Beginning Rests - The first measure in the OMR score is a scanning and parsing error. The `Aligner` is robust enough to identify the beginning rest as a insertion error.
- Rhythmic Fault Tolerance: Propagating Rhythmic Shifts - By measure 5, we see that the OMR score has introduced a 16th note shift in the rhythm which continues for a few measures.
- Notation Fault Tolerance: Tremolos - By measure 5 of the violin 2 part and by measure 10 of the viola part, the repeated 16th notes get notated with tremolo slashes in the original OMR score. Of course, the MIDI protocol doesn't have a way of representing tremolo, so the notes are written out in long form. The corrector is able to match the written out repeated notes in the MIDI to the (incorrectly) scanned corresponding notes in the OMR.

5.1.4 Similarity Metrics

Recall that the `similarityScore` is the ratio of `NoChange` operations to the total number of operations in the `changes` list. For each pair of streams in K.525, the `similarityScore` and `changesCount` are listed below:

	<code>similarityScore</code>	<code>changesCount</code>
Violin 1	0.51	{NoChange: 83, Ins: 30, Del: 10, Sub: 39}
Violin 2	0.30	{NoChange: 74, Ins: 125, Del: 9, Sub: 38}
Viola	0.72	{NoChange: 97, Ins: 21, Del: 9, Sub: 8}
Cello/Bass	0.87	{NoChange: 107, Del: 11, Sub: 5}

Table 5.1: `similarityScore` and `changesCount` for every pair of aligned streams
